

OpenRouter spending reconciliation

Evidence through 20 September 2026, 00:21:07 UTC. All figures are exact US dollars.

KNOWN PROJECT CHARGES

\$0.00774516

45 settled requests | less than one US cent

1 request unresolved

\$0.106496 remains reserved locally.
This hold is not a confirmed charge.

Account balance movement

Initial balance observed on 16 September	\$25.265176805
Balance observed on 20 September, 00:21 UTC	\$12.028542692
Observed account balance decline	\$13.236634113
Matched to this key and the project ledgers	\$0.00774516
Not attributed by the available evidence	\$13.228888953

The account declined by \$13.236634113, but only \$0.00774516 matches this project's recorded charges. The remaining \$13.228888953 is unexplained by the available evidence; it is not assigned to this project or to anyone else.

What the recorded charges paid for

Purpose group	Requests	Known charge (USD)
Connectivity	4	\$0.00001674
Tool checking	1	\$0.00003084
Setup / token calibration	3	\$0.00083352
Harness fixtures	35	\$0.00648960
Real benchmark attempt	3	\$0.00037446
Total: 46 recorded requests, including 1 unknown		\$0.00774516

Setup ledger: \$0.0073707 across 43 calls. Scored ledger: \$0.00037446 across 2 settled calls plus 1 unresolved call. Fixtures are preparation work, not benchmark scores.

Scope, interpretation and evidence

How to read the request register and what this report can establish.

The register is complete for the two project ledgers

Every request in the authoritative setup and scored ledgers appears once on the following pages. Earlier snapshots, migrated copies and synthetic test ledgers are not additional spending. This is all recorded generation requests, not every HTTP transaction or every call in the entire account. The model was DeepSeek V4 Flash 0731, routed through OpenRouter to DeepInfra FP8.

Why these calls were made

Connectivity calls checked the model route and delayed receipts. Tool checking tested structured tool output. Token calibration compared local counts with provider usage. Harness fixtures checked the agents in controlled tasks. Only three requests belong to the first real benchmark attempt. Purpose descriptions summarise project records; the receipt timing diagnostic purpose is explicitly marked as inferred.

Charges, receipts and timestamps

Charges come from integer-nanodollar ledger values and are added using exact decimal arithmetic. A matched receipt must have the same generation ID and exact charge. These are provider-reported charges, not estimates from multiplying token counts by a price. Times are UTC receipt creation times, except the unresolved call, which uses its local dispatch timing. Tokens are provider-native input and output counts; output may include reasoning. A null or unknown charge is never treated as zero.

The key allowance is separate from account credit

The latest key readback reports \$0.00774516 usage, a \$30 limit, \$29.99225484 allowance remaining and no limit reset (null). The shared account balance is \$12.028542692. A remaining key allowance does not mean that amount exists as spendable account credit.

What is excluded, and what remains unresolved

Read-only balance, metadata and receipt queries are not individually logged in these generation ledgers. Earlier local Qwen and CETUS inference work is not OpenRouter spending. Server rental, Codex subscriptions, electricity and other infrastructure costs are excluded because no verified invoice allocation is provided. The missing benchmark response still lacks a generation identity and a confirmed charge; aggregate key usage does not individually reconcile it. To investigate the account difference, the account owner can supply an Activity export for 16-20 September filtered by API key and model. No password or API key is needed.

Connection, tools and setup

8 recorded requests on this page | Known charges: \$0.00088110

01 First model connection

\$0.00000156

Confirm the gateway can obtain a simple model reply.

Trial: compatibility-plain-v1 | Host: Mac

UTC (receipt): 2026-09-16 02:53:29.264Z | Tokens: 14 in / 4 out

Gen: gen-1789527209-4IkGybBjNOGTAnqzdgwh | Ledger request: c2acaefb-83c7-416d-a4ce-f145741a84d0

Settled; receipt matched. Diagnostic / fixture only.

03 Harbor client connection

\$0.00000156

Check the Harbor client reaches the real model through the gateway.

Trial: harbor-http-live-v1 | Host: Mac

UTC (receipt): 2026-09-16 04:16:42.485Z | Tokens: 14 in / 4 out

Gen: gen-1789532202-xCMMXO2wvPnxbleaYKS0 | Ledger request: 2794d6e7-64bf-400f-93b5-44df5b70e0db

Settled; receipt matched. Diagnostic / fixture only.

27 Receipt timing diagnostic

\$0.00000444

Investigate delayed availability of billing receipts. (Purpose inferred.)

Trial: setup-native-receiptlatency-netcupv1 | Host: Netcup native Linux

UTC (receipt): 2026-09-19 13:14:09.948Z | Tokens: 11 in / 21 out

Settled; receipt matched. Overall trial later stopped with unresolved billing.

46 Terminus-2: video processing

CHARGE UNKNOWN

Work on the first selected development benchmark task. Call 3 of 3.
Trial: dev-terminus-2-00-video-processing | Host: Netcup native Linux
UTC (dispatch): 2026-09-19 14:39:46.471Z | Tokens: unknown
Gen: unmapped / unavailable | Ledger request: 03d8ac6c-f2c8-4e3a-9781-be9c8ddadf9f
Unresolved API error; no usable response or receipt. Local hold: \$0.106496 (not a charge).

Status of the benchmark attempt

The first Terminus-2 development trial retained reward zero and an API error. Its first two model calls cost \$0.00037446 in total. The third call returned no usable response or generation identity, so its charge remains unknown and the \$0.106496 reservation remains held. The original failed request was not replayed.

The later endpoint recheck (request 43, on the connection page) cost \$0.00000918. It confirmed that the key and endpoint worked at that time. It did not explain the earlier error, resolve the missing request or complete a benchmark comparison.

No completed harness comparison or demonstrated custom-agent win is established by this spending record.
